## CONVERSION FACTORS AND VERTICAL DATUM

Multiply	By	To obtain
acre-feet (acre-ft)	1,233	cubic meter
cubic feet per second ( $\text{ft}^3/\text{s}$ )	0.02832	cubic meter per second
mile (mi)	1.609	kilometer
square mile ( $\text{mi}^2$ )	2.590	square kilometer

For temperature, degrees Celsius ( $^{\circ}\text{C}$ ) can be converted to degrees Fahrenheit ( $^{\circ}\text{F}$ ) by using the formula  $^{\circ}\text{F}=[1.8(^{\circ}\text{C})]+32$ .

**Sea Level:** In this report, "sea level" refers to the National Vertical Datum of 1929 (NGVD of 1929, formerly called "Sea-Level Datum of 1929"), which is derived from a general adjustment of the first order leveling networks of both the United States and Canada.

# Selected Data on Water Quantity and Quality at Four Sites on Streams Draining Public Lands, Colorado River Basin, Southeastern Nevada, October 1988 - September 1991

By Gary C. Gortsema

## Abstract

Control of dissolved-solids concentrations (salinity) in the Colorado River Basin is an important water-quality management issue. Excessive dissolved-solids concentrations in the Colorado River economically affect public water supplies and irrigation. In addition, dissolved-solids concentrations are a political issue, because of the international agreement between the United States and Mexico on the quality of water in the Colorado River at the border.

The Nevada part of the Colorado River Basin encompasses about 12,000 square miles, of which 70 percent is public land. Water-quality monitoring stations existing before 1988 were at or near the mouths of tributaries flowing into Lake Mead on the Colorado River below multiple sources of dissolved solids. Thus, data were insufficient to assess what percentage of the overall dissolved-solids contribution to the Colorado River comes from public lands. To assess that contribution in southeastern Nevada, four streamflow and water-quality stations were established, one each on Pahranagat Wash, Muddy River, Meadow Valley Wash, and Las Vegas Wash. Streamflow data and specific-conductance data (an indirect, approximate measure of dissolved-solids concentration) were recorded half-hourly at Pahranagat Wash and Las Vegas Wash, and hourly at Muddy River and Meadow Valley Wash. In addition, water samples were collected during station

visits and analyzed for instantaneous specific conductance and dissolved-solids concentration. Additional water samples were collected during selected periods of storm runoff.

Data collected at the four sites from October 1988 through September 1991 are presented in tabular format in this report. These data provide information for characterizing the dissolved-solids contribution from public lands in southeastern Nevada to the Colorado River.

## INTRODUCTION

Control of dissolved solids<sup>1</sup> (salinity) in the Colorado River Basin is an important water-quality management issue. Excessive dissolved-solids concentrations in the Colorado River economically affect public water supplies and irrigation. In addition, dissolved-solids concentrations are a political issue, because of the international agreement between the United States and Mexico on the quality of water in the Colorado River at the International Boundary (U.S. Bureau of Reclamation, 1991).

The Nevada part of the Colorado River basin encompasses about 12,000 mi<sup>2</sup>, of which 70 percent is public land. The U.S. Bureau of Land Management (USBLM) is responsible for managing large tracts of public land in Nevada. Water-quality monitoring stations existing before 1988 were at or near the mouths of tributaries to Lake

---

<sup>1</sup>For the purpose of this report, dissolved solids and salinity are synonymous.

Mead on the Colorado River (fig. 1), below multiple sources of dissolved solids. Data collected at these sites were insufficient to assess what percentage of the overall dissolved-solids contribution to the river comes from public lands.

The U.S. Geological Survey (USGS), in cooperation with the USBLM, began a 5-year program in October 1988 to assess the contribution of dissolved solids from public lands in the Colorado River basin of southeastern Nevada. As part of this study, four gaging stations were established, one each on Pahranagat Wash, Muddy River, Meadow Valley Wash, and Las Vegas Wash (fig. 1). All but the Muddy River gage are above major urban and agricultural developments.

The Pahranagat Wash gage is in an ephemeral channel about 9 mi northwest of Moapa and about 4 mi northwest of the Muddy River gage. Flow in Pahranagat Wash at the gage is primarily storm related. Surface runoff past the gage may not reach the Muddy River because of infiltration and evaporation.

The Muddy River gage is about 5 mi northwest of Moapa. Perennial springs are the source of the Muddy River, and flow continuously reaches Lake Mead.

The Meadow Valley Wash gage is about 14 mi north of Moapa. The flow is perennial at the gage, but it is intermittent at some reaches of the wash upstream and downstream of the gage. Flow infiltrates about 3 mi downstream, and only during extreme snowmelt runoff or intense storms does surface flow reach the Muddy River.

The Las Vegas Wash gage is about 4 mi northwest of North Las Vegas, above urban development. The channel is ephemeral, and small flows may be contained in a manmade detention basin about 1/2 mi below the gage. Larger flows reach and pass through the detention-basin outlet.

The purpose of this report is to present tabulations of selected water-quantity and water-quality data collected at the four sites from October 1988 through September 1991. The data include daily mean streamflow, daily mean specific conductance, miscellaneous measurements of

streamflow and specific conductance, and laboratory determinations of dissolved-solids concentration. At completion of the 5-year study, the accumulated data can be used to estimate the magnitude of dissolved-solids contributions from public lands. These estimates, in turn, may help form a basis for development of salinity-control programs.

## BASIC DATA

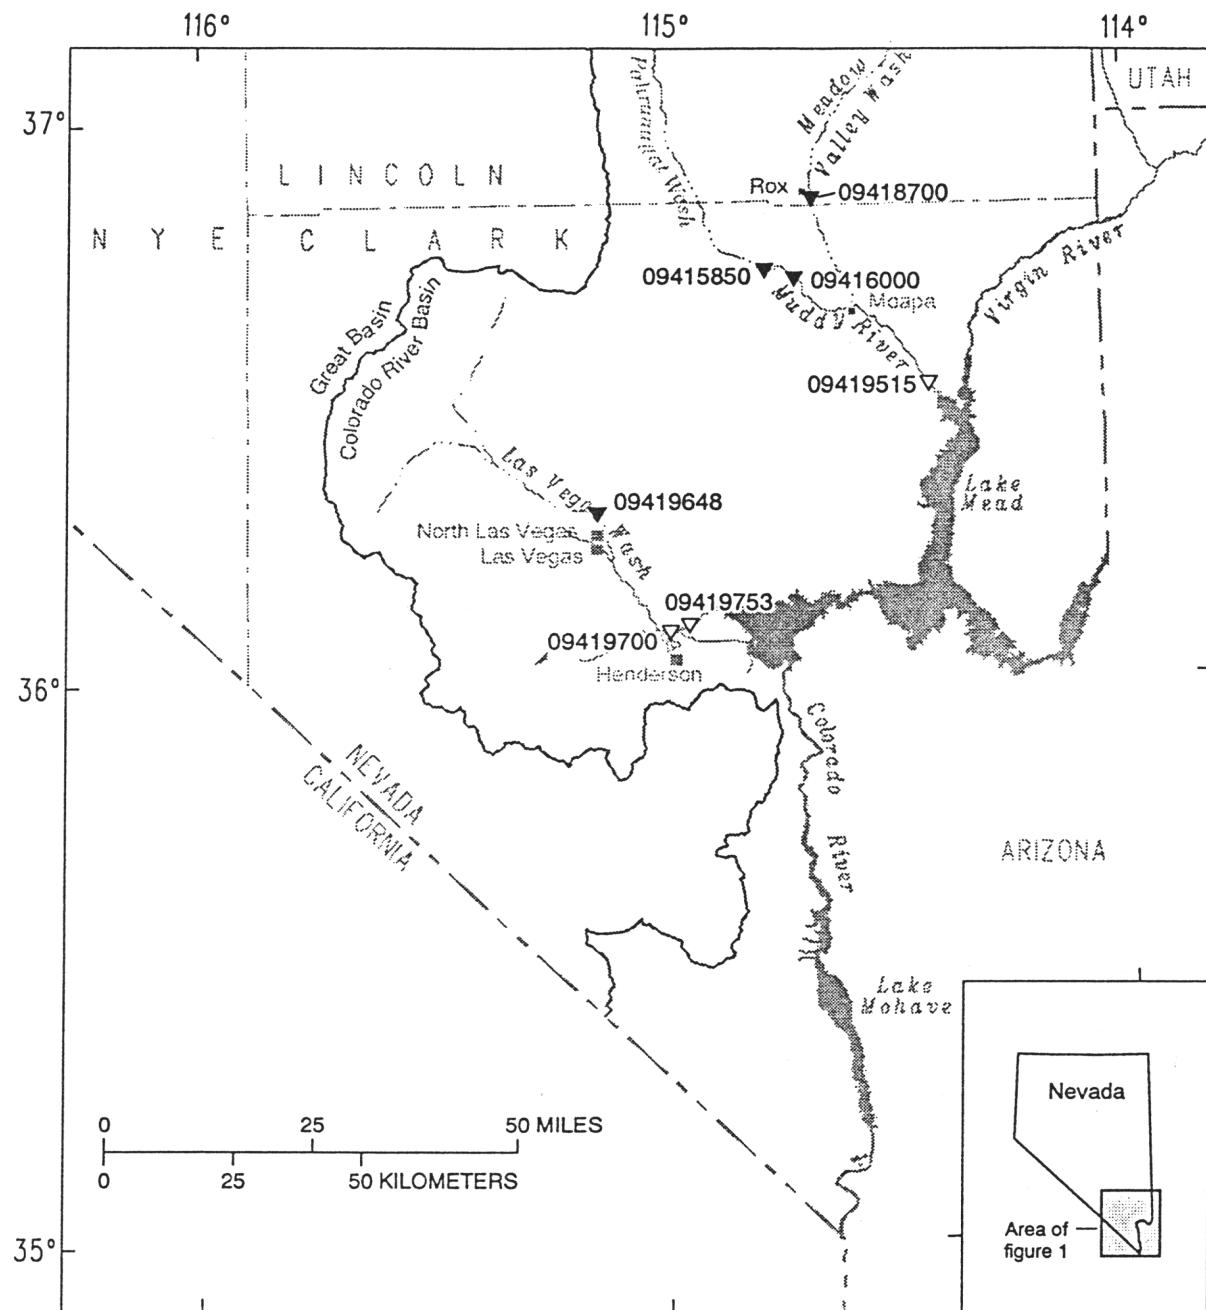

Data-collection instruments at the four sites include continuous streamflow and specific-conductance recorders. Streamflow data and specific-conductance data were recorded half-hourly at Pahranagat Wash and Las Vegas Wash, and hourly at Muddy River and Meadow Valley Wash. The four sites were visited about once a month.

Daily mean streamflow at the four sites is listed in tables 2-5. Pahranagat Wash and Las Vegas Wash sites are ephemeral channels, and days of no flow are recorded as 0.00 ft<sup>3</sup>/s. Missing values of daily mean streamflow are estimated and noted with an 'e'.

Daily mean specific conductances are listed in tables 6-9. Conductance is the ability of a solution to conduct an electrical current due to the presence of dissolved, ionized constituents. As the concentration of dissolved constituents increases, the conductance of the solution also increases. The specific-conductance measurement, therefore, is an indirect, approximate measure of dissolved-solids concentration (Hem, 1985, p. 66-69). No specific conductance was recorded at the Pahranagat Wash gage during water year<sup>2</sup> 1989, and the Las Vegas Wash gage during water years 1989 and 1991, even though flow occurred. Missing values of specific conductance are not estimated; instead, they are noted as "not determined."

Table 1 summarizes the data on daily mean streamflow and specific conductance listed in tables 2-9 for October 1988 through September 1991.

<sup>2</sup>Water year is the 12-month period from October 1 through September 30, designated by the calendar year in which it ends.

#### EXPLANATION

- BOUNDARY BETWEEN COLORADO RIVER BASIN AND GREAT BASIN
- 09419753 ▽ STATION EXISTING AT START OF STUDY
- 09419648 ▼ STATION ESTABLISHED FOR THIS STUDY

FIGURE 1.--Streamflow and water-quality stations, southeastern Nevada.

Instantaneous measurements of streamflow and specific conductance made during routine and storm-related visits are listed in tables 10-13. Water samples that were collected during the visits were analyzed for dissolved-solids concentration, in terms of milligrams per liter, at the

U.S. Geological Survey National Water-Quality Laboratory in Arvada, Colo. These data are listed in tables 10-13. These and other water-quality data collected as part of this project are presented in the U.S. Geological Survey annual water-resources data reports for Nevada (U.S. Geological Survey, 1990-92).

**Table 1.** Summary of data on streamflow and specific conductance at study sites, October 1988-September 1991

[Abbreviations: e, estimated; microsiemens, microsiemens per centimeter at 25 degrees Celsius]

Stream site	Streamflow				Specific conductance			
	Cubic feet per second				Microsiemens			
	Number of days of flow	Mean for period of flow	Maximum instantaneous	Minimum daily	Number of days of record	Mean for period of record	Maximum recorded	Minimum recorded
Pahranagat Wash near Moapa	19	38.3	e3,350	0.00	16	237	550	112
Muddy River near Moapa	1,095	35.4	e5,760	26	704	1,000	1,470	496
Meadow Valley Wash near Rox	1,095	1.26	e550	.20	972	1,470	7,460	368
Las Vegas Wash above detention basin near North Las Vegas	11	1.26	e278	.00	2	162	225	128

**Table 3. Daily mean streamflow, Muddy River near Moapa (09416000)**

**LOCATION.**--Lat  $36^{\circ}42'40''$ , long  $114^{\circ}41'40''$ , in SE 1/4 SE 1/4 sec. 15, T. 14 S., R. 65 E., Clark County, Hydrologic Unit 15010012, on left bank, 0.1 mi upstream from Battleship Wash, 0.8 mi downstream from Home Ranch, 5 mi northwest of Moapa, 9.5 mi upstream from Meadow Valley Wash, and 26 mi upstream from Lake Mead.

**DRAINAGE AREA.**--3,820 mi<sup>2</sup>, approximately, of which about 40 mi<sup>2</sup> contributes directly to surface runoff.

**PERIOD OF RECORD.**--July 1913 to September 1915, April 1916 to September 1918, June 1928 to October 1931, April to July 1932, October 1944 to current year. Monthly streamflow only for some periods, published by U.S. Geological Survey (1954). Records for January 1904 to December 1906 (gage heights only), 1908-9 (streamflow measurements only), and April to October 1910 not equivalent owing to large difference in drainage area.

**EXTREMES FOR PERIOD OF RECORD.**--Maximum streamflow, 5,760 ft<sup>3</sup>/s, August 16, 1990, on basis of slope-area measurement of peak flow; minimum daily, 20 ft<sup>3</sup>/s, October 13, 1985, and August 21, 1986.

**ABBREVIATIONS.**--AC-FT, acre-feet; E., east; e, estimated; ft<sup>3</sup>/s, cubic feet per second; lat, latitude; long, longitude; MAX, maximum; mi, mile; mi<sup>2</sup>, square mile; MIN, minimum; R., range; S., south; SE, southeast; sec., section; T., township

**Table 5. Daily mean streamflow, Las Vegas Wash above detention basin near North Las Vegas (09419648)**

LOCATION.--Lat 36°18'09", long 115°08'18", in SE 1/4 NW 1/4 sec. 15, T. 19 S., R. 61 E., Clark County, Hydrologic Unit 15010015, on left bank, 0.5 mi upstream of North Las Vegas detention basin dam, 5.2 mi north of Craig Road, and 4.5 mi northwest of North Las Vegas.

DRAINAGE AREA--Not determined.

PERIOD OF RECORD.--July 1988 to current year.

EXTREMES FOR PERIOD OF RECORD.--Maximum streamflow, 278 ft<sup>3</sup>/s, July 15, 1990, on basis of indirect measurement of peak flow; no flow most days.

ABBREVIATIONS.--AC-FT, acre-feet; E., east; e, estimated; ft<sup>3</sup>/s, cubic feet per second; lat, latitude; long, longitude; MAX, maximum; mi, mile; mi<sup>2</sup>, square mile; MIN, minimum; NW, northwest; R., range; S., south; SE, southeast; sec, section; T., township

**Table 8.--Daily mean specific conductance, Meadow Valley Wash near Rox (09418700)**

PERIOD OF RECORD.--October 1988 to current year.

EXTREMES FOR PERIOD OF DAILY RECORD.--Maximum recorded, 7,460 microsiemens, January 18, 1990; minimum recorded, 368 microsiemens, September 23, 1990.

ABBREVIATIONS.--°C, degrees Celsius; MAX, maximum; microsiemens, microsiemens per centimeter at 25 degrees Celsius; MIN, minimum; \*\*\*, flow occurred, but conductance not determined.

**Table 9.** Daily mean specific conductance, Las Vegas Wash above detention basin near North Las Vegas (09419648)

PERIOD OF RECORD---September 1989 to current year.

EXTREMES FOR PERIOD OF DAILY RECORD.--Maximum recorded, 225 microsiemens, August 15, 1990; minimum recorded, 128 microsiemens, September 23, 1990.

ABBREVIATIONS.--°C, degrees Celsius; MAX, maximum; microsiemens, microsiemens per centimeter at 25 degrees Celsius; MIN, minimum; ---, no flow; \*\*\*, flow occurred, but conductance not determined.
